# Biofuel comparisons

## Biofuel

## Fossil fuel

**Coppice (poplar)**

Light oil / natural gas – heat plant

**Willow**

Light oil / natural gas – heat plant

**Miscanthus**

Light oil / natural gas – CHP plant

**Giant reed**

Light oil / natural gas – CHP plant

**Cocksfoot**

Light oil / natural gas – heat plant

**Whole crop wheat**

Light oil / natural gas – heat plant

**Biogas (liquid manure)**

Light oil / natural gas – SChP plant

**Biogas (silage corn)**

Light oil / natural gas – SChP plant

**Biogas (rape seed meal)**

Light oil / natural gas – SChP plant

**RME**

Diesel oil – passenger car / HDV

**SME**

Diesel oil – passenger car / HDV

**Rapeseed oil**

Diesel oil – passenger car / HDV

**EtOH (sugar beet)**

Gasoline (E5/E100) – passenger car

**ETBE (sugar beet)**

MTBE as an additive in gasoline

**Biomethanol**

Gasoline (M5/M10) – passenger car

# Background

---

- **Bioenergy for Europe: which ones fit best? A comparative analysis for the community. Report. *Supported by the European Commission. DG XII, 2000***
- **Development of the Clean Technologies Information Pool. *By order of: The World Bank, 2002***
- **Environmental comparison of motor vehicles with different types of fuels and drive systems with special focus on fuel cells. *By order of: Office of Technology Assessment at the German Parliament (TAB), 1999***
- **Environmental comparison of RME and rape seed oil. *Supported by the Federal Ministry for Consumer Protection, Nutrition, and Agriculture, 2001***
- **LCA of bioenergy sources. Data, results, valuations. *Supported by the German Federal Environmental Foundation, 2000***

# Biofuels

## Environmental advantages and disadvantages:

+

- CO<sub>2</sub> neutral
- Save energetic resources
- Not toxic
- Less transport
- etc.

-

- Land use
- Eutrophication of surface water
- Water pollution by pesticides
- Energy intensive production
- etc.

Total:  
positive or negative  
?

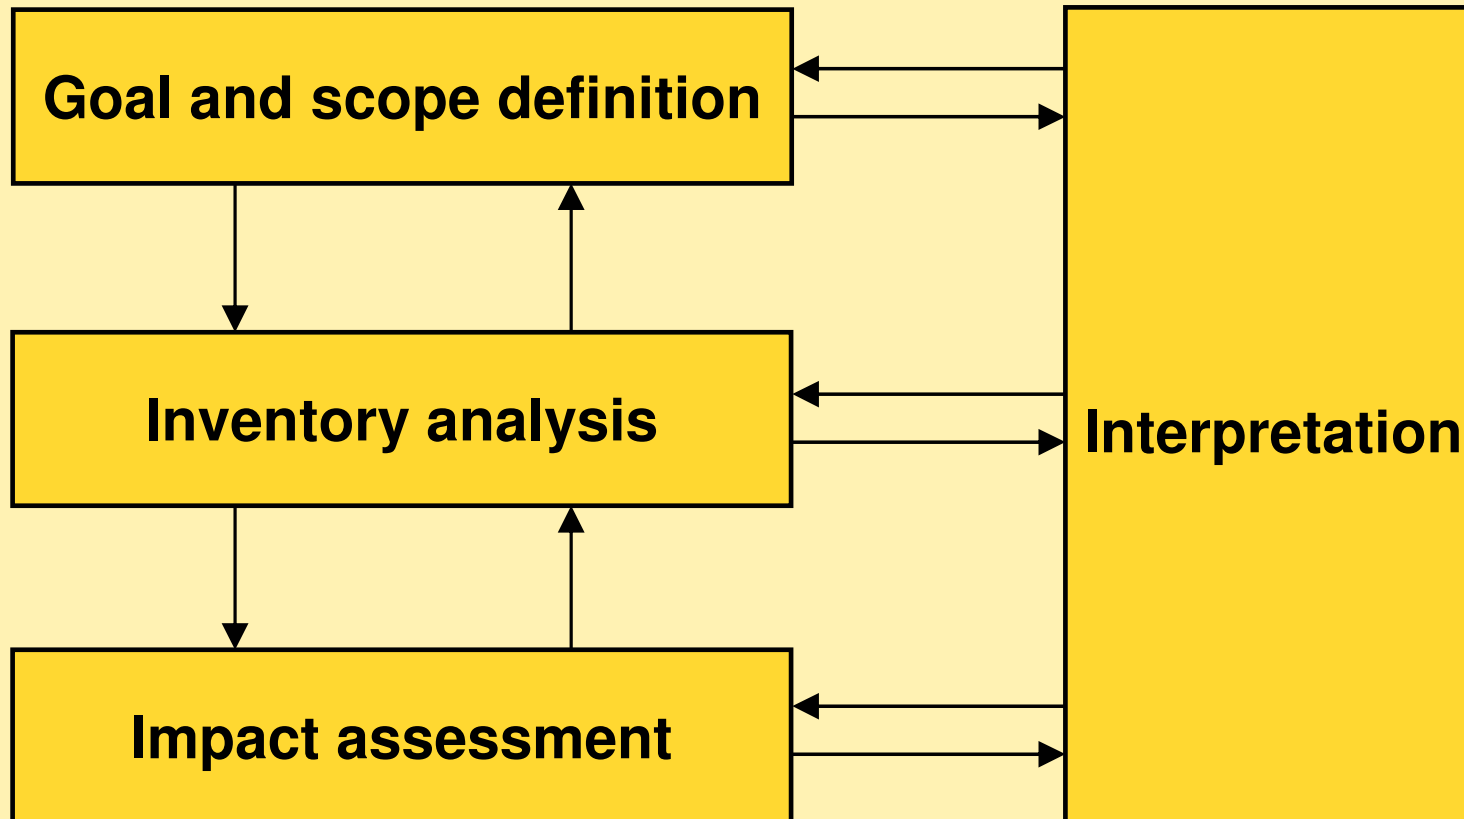

"HEY, I THOUGHT WE WERE WORKING WITH THE SAME DATA..."

# LCA: Inventory Analysis

## Inputs

e.g.:

- natural gas
- crude oil
- brown coal
- hard coal
- uranium
- water

## Outputs

e.g.:

- CO<sub>2</sub>
- SO<sub>2</sub>
- CH<sub>4</sub>
- NO<sub>x</sub>
- NH<sub>3</sub>
- N<sub>2</sub>O
- HCl
- CO
- C<sub>6</sub>H<sub>6</sub>
- VOC

# Life Cycle Inventory (LCI)

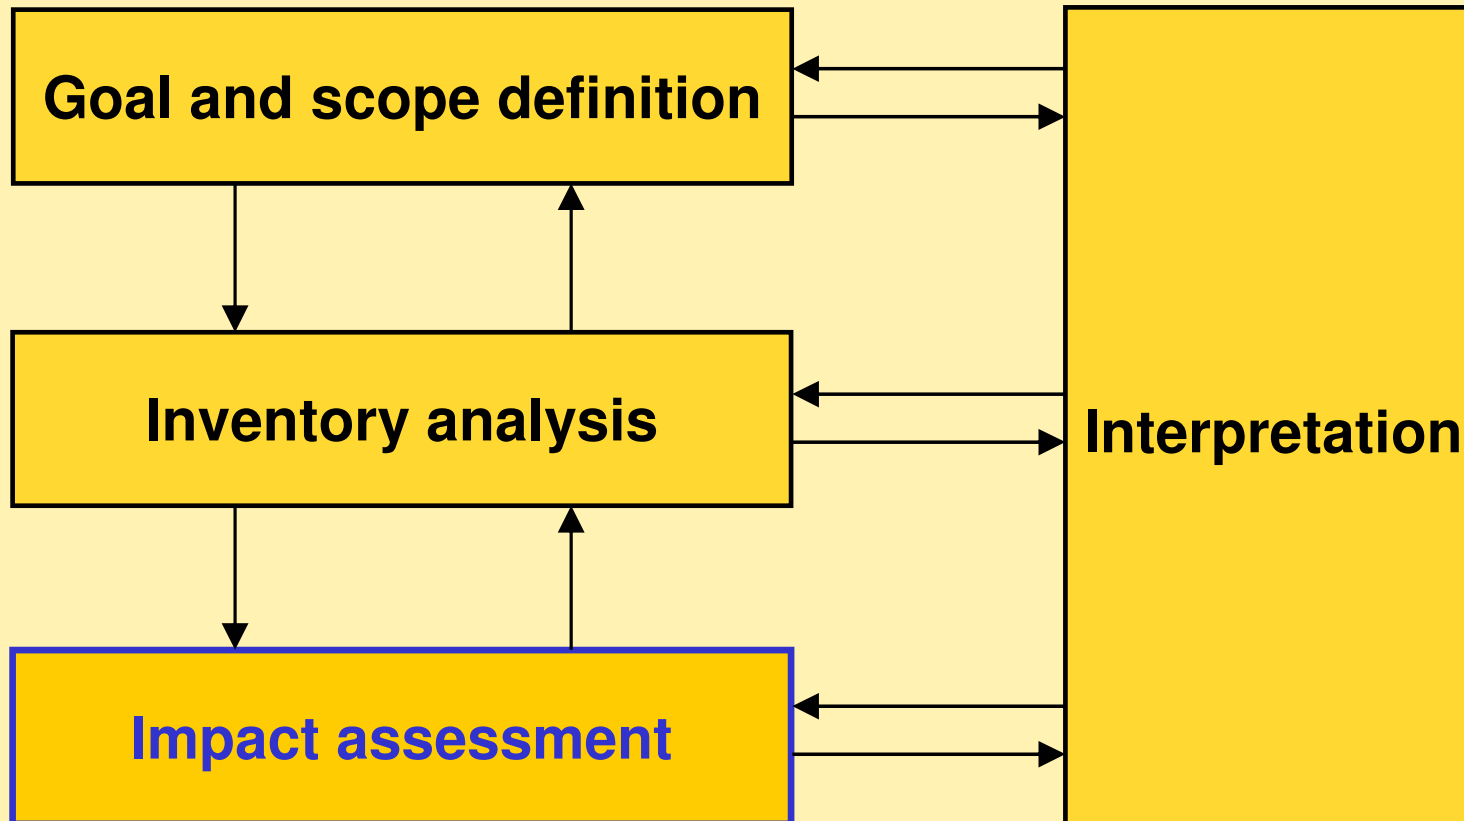

Inventory parameters	Unit	Rape seed oil
per ha*a		
Crude oil	MJ	-62.279
Natural gas	MJ	5.697
Hard coal	MJ	313
Lignite	MJ	-148
Urane	MJ	-74
Water	MJ	7
Limestone	kg	45
Raw phosphate	kg	126
Sulphur	kg	8
Potassium	kg	811
Rock salt	kg	0
Clay	kg	0
CO <sub>2</sub> (fossile)	kg	-3.987
CH <sub>4</sub>	kg	1

Inventory parameters	Unit	Rape seed oil
per ha*a		
N <sub>2</sub> O	kg	5
SO <sub>2</sub>	kg	2
NO <sub>x</sub>	kg	5
HCl	g	-10
NH <sub>3</sub>	kg	4
CO	kg	2
NMHC	kg	-2
Diesel particulate	g	-405
Dust	g	-362
Formaldehyde	g	29
Benzene	g	-30
Benzo(a)pyrene	mg	2
TCDD	ng	-394

# Biogas vs. fossil fuel

## Advantages for biogas

## Disadvantages for biogas

---

<b>Resource demand</b>	savings of finite energy resources	consumption of mineral resources
------------------------	------------------------------------	----------------------------------

---

<b>Greenhouse effect</b>	lower emissions of greenhouse gases	
--------------------------	-------------------------------------	--

---

<b>Ozone depletion</b>		more N <sub>2</sub> O emissions
------------------------	--	---------------------------------

---

<b>Acidification</b>		higher acidification
----------------------	--	----------------------

---

<b>Eutrophication</b>		higher NO <sub>x</sub> emissions <b>risk:</b> eutrophication of surface waters
-----------------------	--	---

---

<b>Human- and ecotoxicity</b>	less pollution of oceans due to extraction and transport of crude oil <b>risk:</b> less pollution by oil spillage after accidents <b>risk:</b> less toxicity / better biodegradability	<b>risk:</b> pollution of surface waters by pesticides <b>risk:</b> pollution of ground water by nitrate
-------------------------------	--	---

# LCA: Interpretation

---

## Statistics about Heidelberg

---

<b>Inhabitants</b>	<b>130.000</b>
<b>School buildings (including university)</b>	<b>180</b>
<b>Bridges</b>	<b>5</b>
<b>Dogs</b>	<b>220</b>
<b>Tourists per day</b>	<b>5.500</b>
<hr/>	
<b>Total</b>	<b>135.905</b>

# LCA: Interpretation

<b>Impact category</b>	<b>Parameter</b>	<b>Ecological significance</b>
<b>Resource demand</b>	<b>Cumulative energy demand (non-renew.)</b>	<b>important</b>
<b>Greenhouse effect</b>	<b>CO<sub>2</sub> equivalents</b>	<b>very important</b>
<b>Ozone depletion</b>	<b>Nitrous oxide</b>	<b>(very) important</b>
<b>Acidification</b>	<b>SO<sub>2</sub> equivalents</b>	<b>medium relevance</b>
<b>Eutrophication</b>	<b>PO<sub>4</sub> equivalents</b>	<b>medium relevance</b>
<b>Human- and Ecotoxicity</b>	<b>Nitrogen oxide</b>	<b>medium relevance</b>
<b>Human- and Ecotoxicity</b>	<b>Diesel particulates</b>	<b>very important</b>

+ Advantage for biofuel    - Advantage for fossil fuel    +/- Insignificant or ambiguous

# Results: Biofuels vs. fossil fuels

---

1. All biofuels listed hold ecological advantages as well as disadvantages in comparison with fossil fuels.
2. In nearly all cases biofuels reveal **advantages** with respect to both saving non-renewable energy carriers and greenhouse effect.
3. Likewise, in most cases biofuels exhibit **disadvantages** in respect of acidification and eutrophication.
4. In the categories photo smog, ozone depletion and human and ecotoxicity the results are non-uniform.

# Results: Biofuels vs. fossil fuels

---

5. An **objective decision** for or against a particular fuel **cannot be made**. However, based on a subjective value system a decision is possible.

If, for example, energy saving and greenhouse effect is given the highest priority, all of the biofuels studied perform better than the alternative fossil fuels.

# Comparisons

---

- **Biofuels vs. fossil fuels**
- **Biofuels vs. biofuels**

# Biofuels vs. biofuels

# Results

---

- Solid biofuels usually perform better than liquid biofuels from energy crops.
- Biogas options based on energy crops lie within the range of liquid and solid biofuels.
- Biofuels from residues are to be interpreted separately.

# Comparisons

---

- **Biofuels vs. fossil fuels**
- **Biofuels vs. biofuels**
  - **solid biofuels**
  - **biofuels for transportation**
  - **biofuels from residues**

# Solid biofuels vs. light oil

# Miscanthus vs. fossil fuels

Advantage for Miscanthus

Heating plant: light oil

Heating plant: natural gas

Combined heat and power: light oil

Central heating: light oil

Central heating: natural gas

Power plant: hard coal

kg CO<sub>2</sub> equivalents / ha

# Results: **solid biofuels**

---

1. Willow and poplar (SRC) show ecological **advantages** over perennial grasses and wheat and triticale
2. Perennial grasses compared to wheat and triticale: no final conclusion as there are both, advantages and disadvantages
3. Compared to poplar, **willow** saves more fossil resources while there are no significant differences with the other categories
4. To have most ecological benefits, first choice is to **substitute coal** by biofuels, second is fuel oil

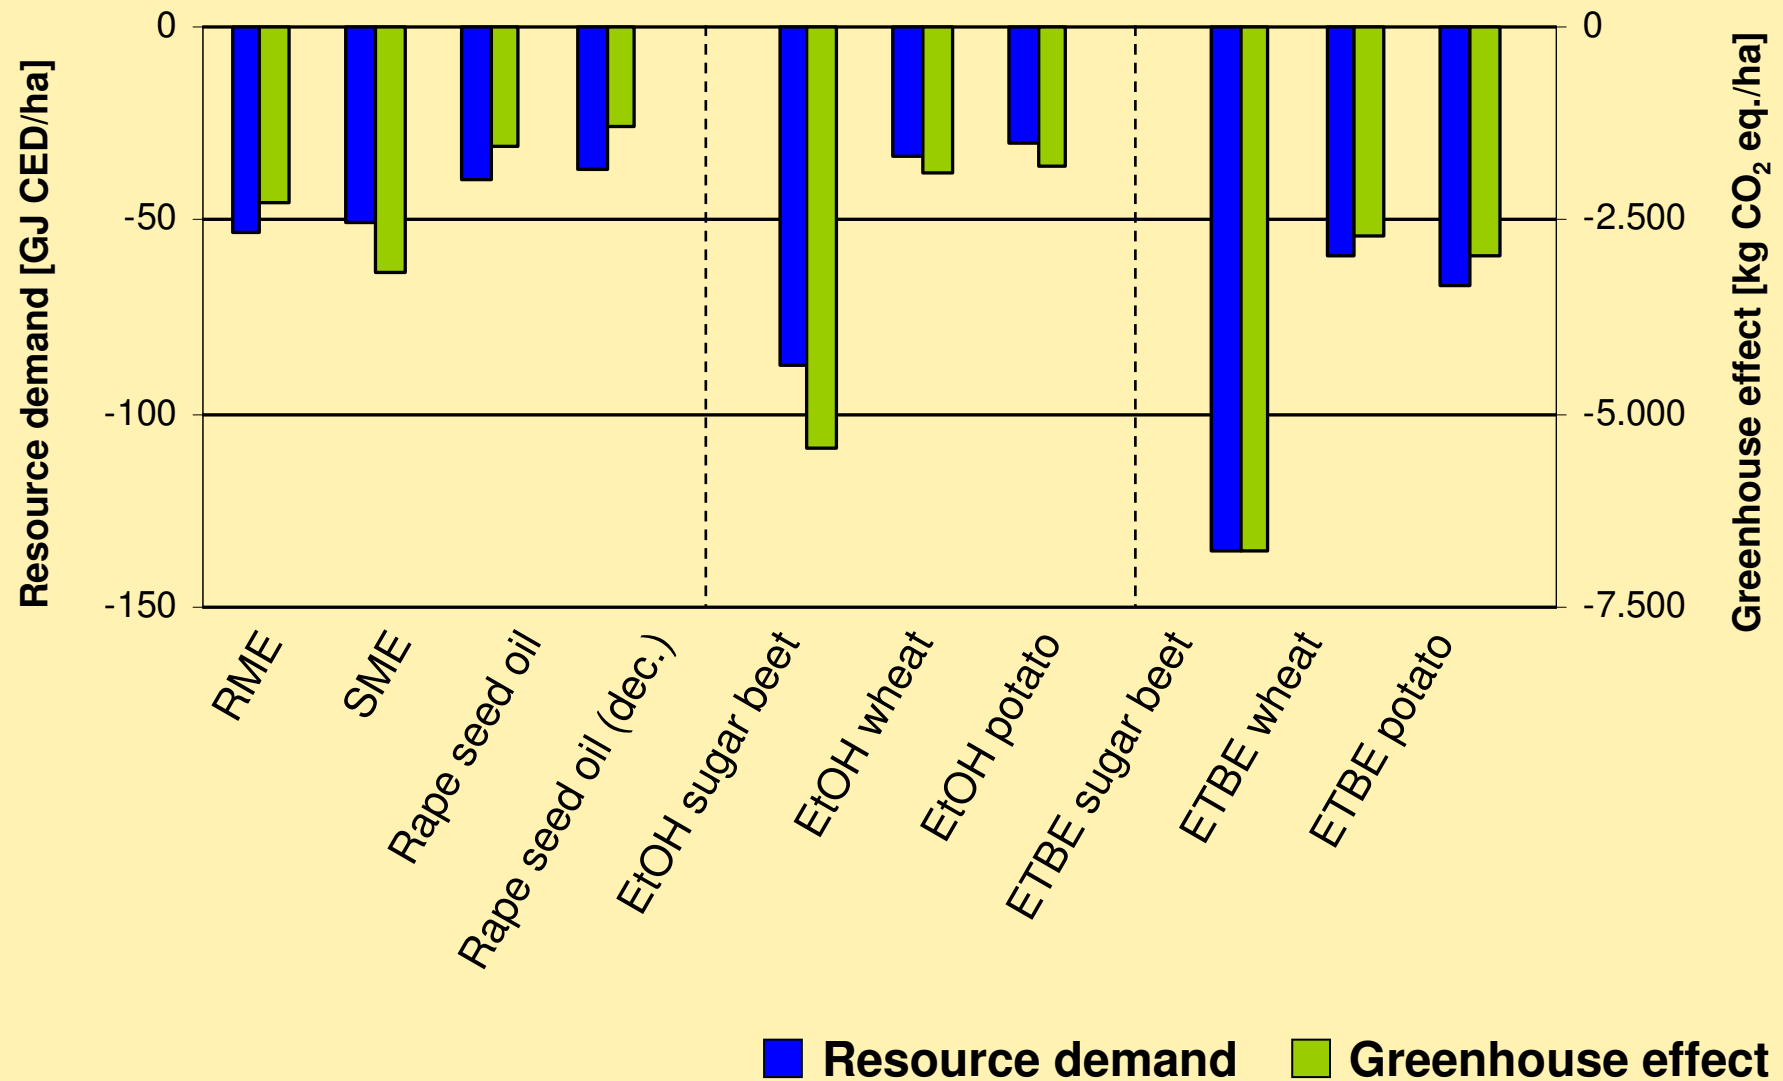

# Comparisons

---

- **Biofuels vs. fossil fuels**
- **Biofuels vs. biofuels**
  - **solid biofuels**
  - **biofuels for transportation**
  - **biofuels from residues**

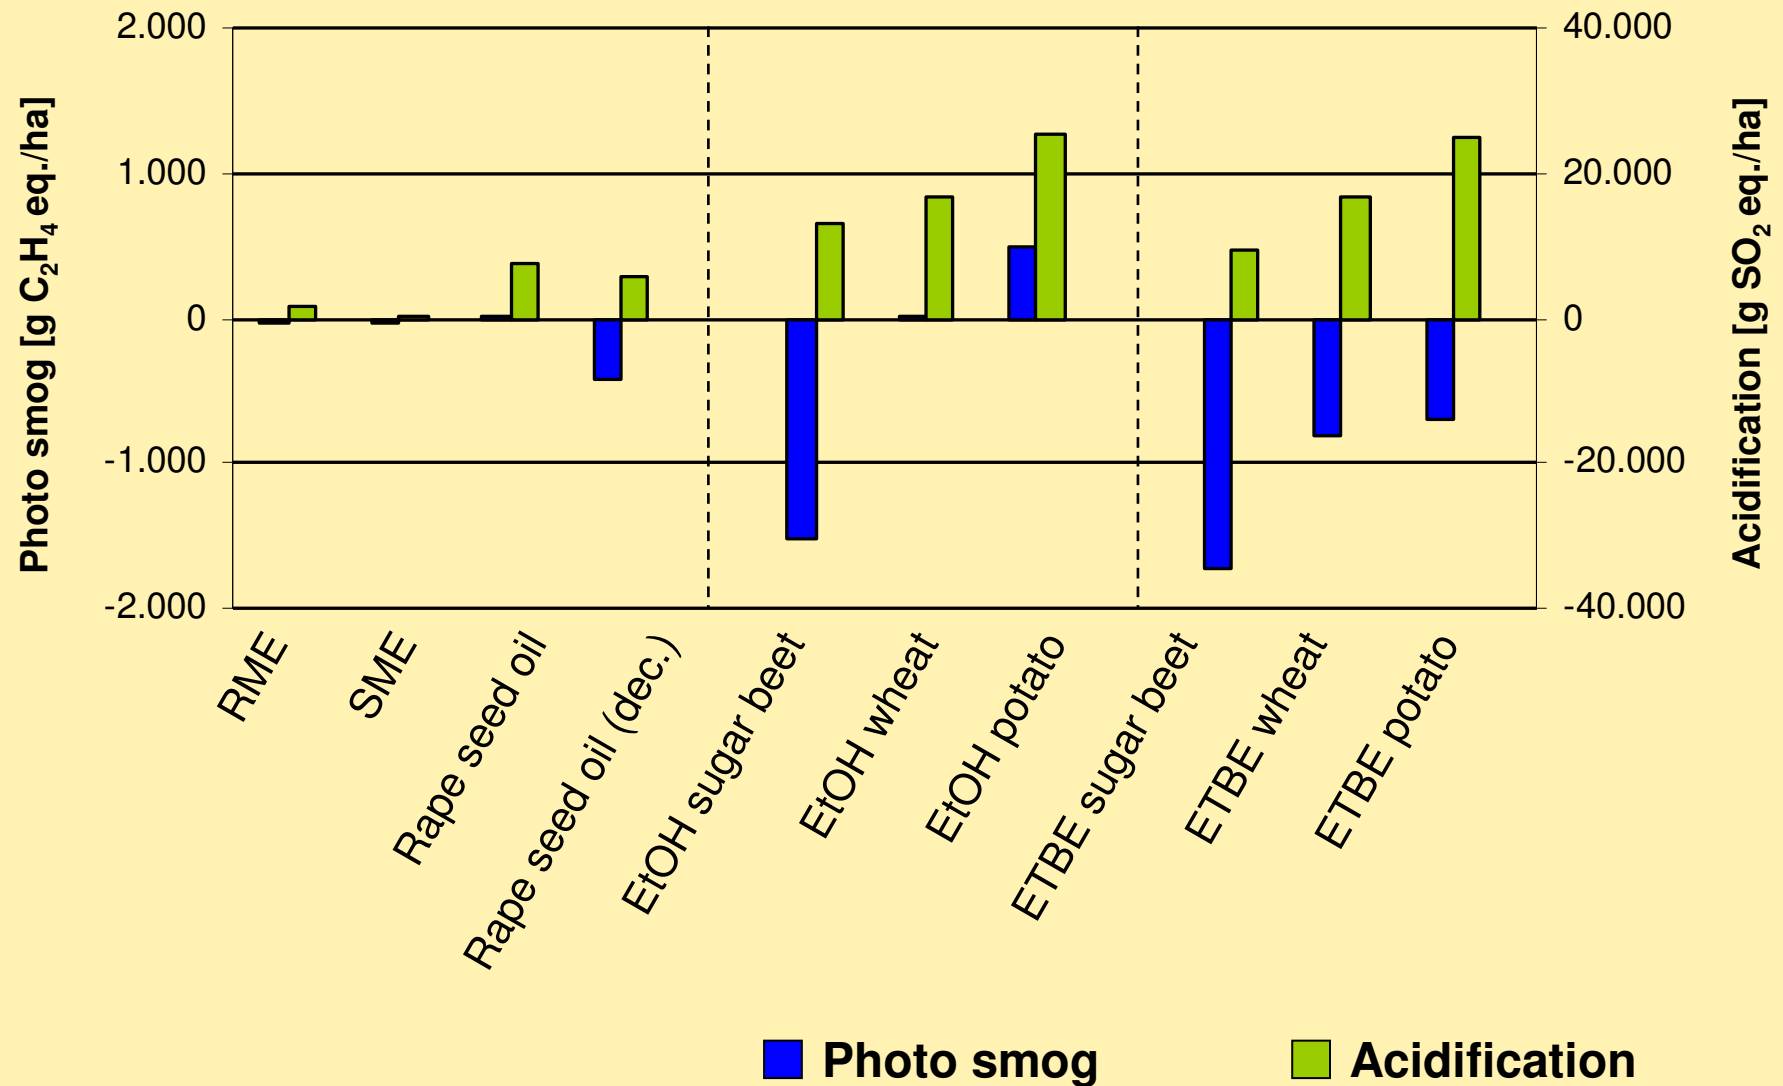

# Biofuels versus Biofuels

# Biofuels versus Biofuels

# Biofuels versus Biofuels

# Results: Biofuels vs. biofuels

---

1. **SME** shows better results than RME
2. **RME** turns out to be better than pure rape seed oil
3. **Central pressing of rape seed oil** shows better results compared to local pressing
4. Investigated options for Bioethanol and ETBE (particularly ETBE from sugar beet) are significantly better than biofuels from vegetable oil (SME, RME, pure rape seed oil)

# Results: Biofuels vs. biofuels

---

5. **ETBE** shows better results than Ethanol
6. **Ethanol from sugar beet** shows advantages compared to wheat and potato
7. **Wheat** comes out second best, potato shows least favourable results in all categories apart from  $N_2O$
8. For **synfuels** and **sunfuels** as well as for the various ways to generate **bioethanol from residual organic biomass resp. lignocellulose** reliable life cycle assessments are currently unavailable. Screening life cycle assessments resp. preliminary screenings however indicate considerable ecological potentials.

# Comparisons

---

- **Biofuels vs. fossil fuels**
- **Biofuels vs. biofuels**
  - **solid biofuels**
  - **biofuels for transportation**
  - **biofuels from residues**

# CO<sub>2</sub> efficiency

[kg CO<sub>2</sub>-eq. / GJ  
primary energy saved]

■ Biogas      ■ Solid biofuel      ■ Liquid biofuel

# Results: Biofuels from residues

---

- 1. With respect to CO<sub>2</sub> efficiency solid biofuels perform better than both liquid biofuels and biogas in most cases.**
- 2. Nevertheless, the performance of biogas lies in a large range.**
- 3. Additional advantage compared to energy crops: No land is necessary to produce them.**

# Biogas or other modes of use ?

---

## Biogas from energy crops or co-products

Biogas from corn

Biogas from rape seed meal

← versus →

## Other modes of use

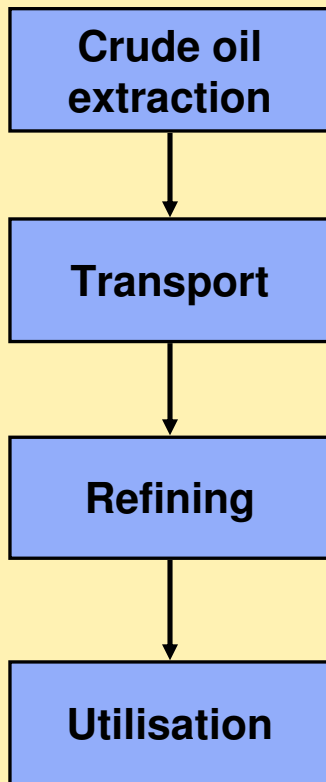

Corn: direct combustion

Rape seed meal: combustion or animal feed

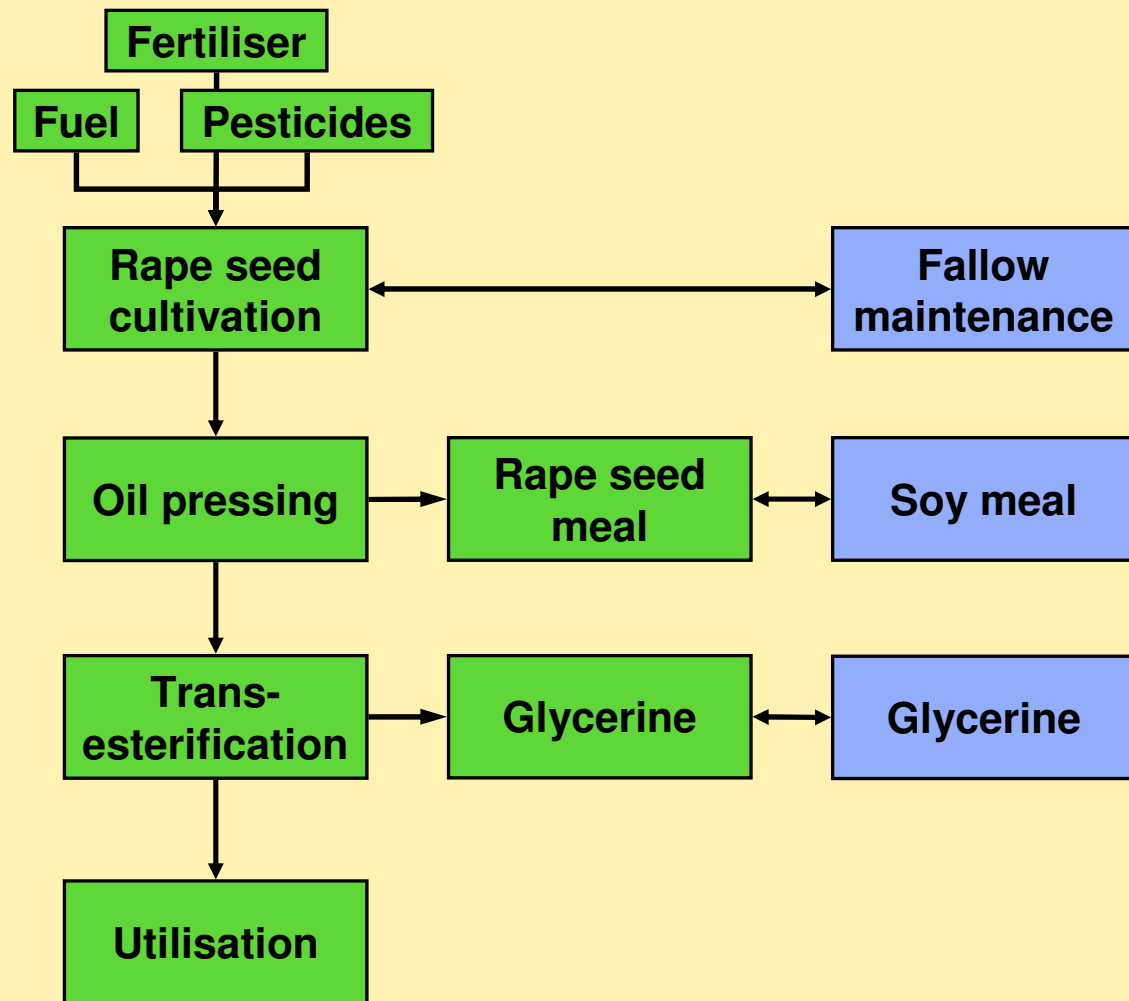

# RME vs. Diesel

## Diesel fuel

## RME

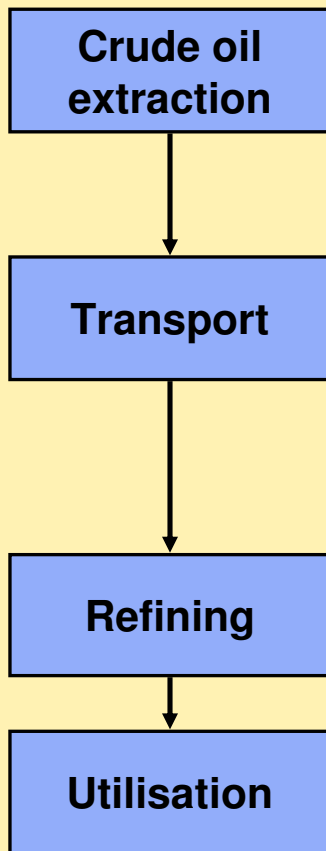

## Credits

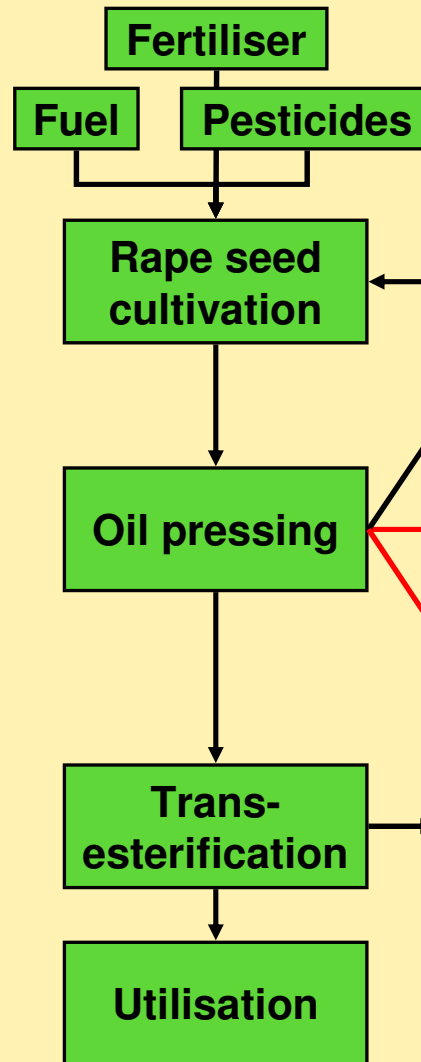

# RME vs. Diesel

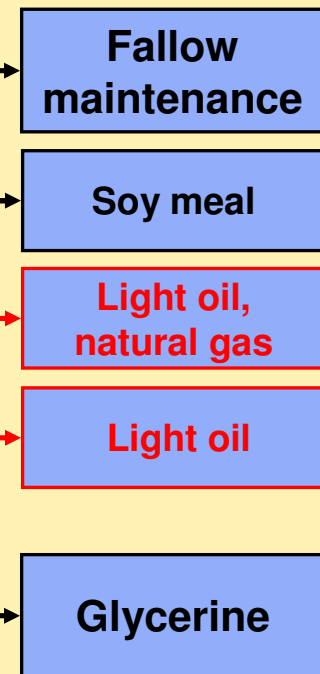

## Diesel fuel

## RME

## Credits

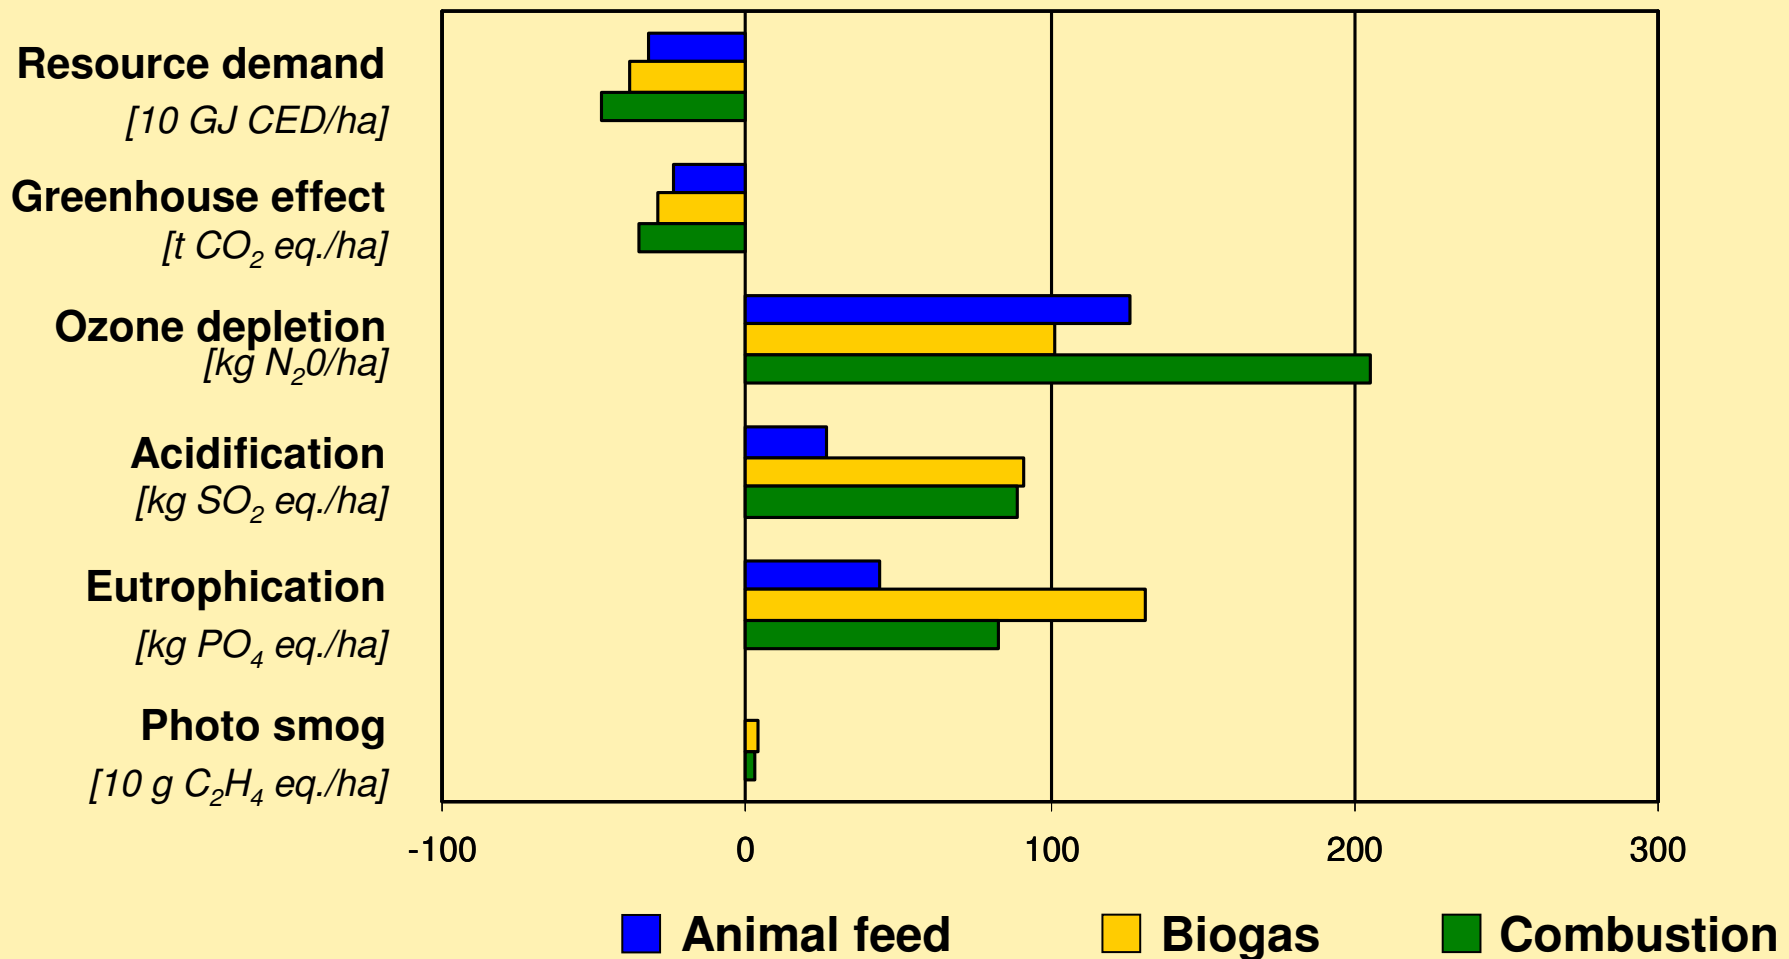

# RME vs. Diesel

**Advantage for RME**

**Advantage for Diesel**

# Results: Biofuels vs. fossil fuels

---

1. All biofuels have **advantages** and **disadvantages** compared to fossil fuels
2. An objective decision in favour of one or another fuel is not possible but can be done using subjective value systems
3. When giving energy savings of fossil resources and greenhouse gases highest ecological importance, all investigated biofuels compare favourably to their fossil alternatives

# Results: Biofuels vs. biofuels

---

- Solid biofuels usually perform better than liquid biofuels from energy crops.
- Biogas options based on energy crops lie within the range of liquid and solid biofuels. Detailed analyses are necessary to determine their impacts. Some biogas options may have a high environmental potential.

## Results: Solid biofuels

---

- Wood chips show ecological advantages over perennial grasses and wheat
- Compared to poplar, **willow** saves more fossil resources while there are no significant differences with the other categories
- To have most ecological benefits, first choice is to **substitute coal** by biofuels, second is fuel oil

# Results: Liquid biofuels

---

- Ranking of biofuels from energy crops: ETBE / EtOH, SME / RME, plant oil
- Both, **bio-DME** and **bio-methanol**, show much better results than biofuels from agriculture.
- For **synfuels** and **sunfuels** as well as for the various ways to generate **bioethanol** from residual organic biomass resp. **lignocellulose** reliable life cycle assessments are currently unavailable.

# Conclusions I

---

- Biogas - like other forms of bioenergy - has the potential to **save non-renewable energy carriers** and thus to **reduce greenhouse gas emissions**.
- Biogas - again similar to other bioenergies - affects the environment with respect to other impact categories like **acidification, eutrophication, photo smog and ozone depletion**.

# Conclusions II

---

- In most cases, from the environmental point of view, direct combustion of the biomass may be preferred to biogas production.
- However, a number of non-ecological reasons like for instance logistics, manageability etc. may argue for the use of biogas.

# Conclusions III

---

- Biogas can compete easily with the most excellent solid biofuels and at the same time provides a number of possible applications.
- Due to large number of possibilities to generate and to utilise biogas, the environmental implications have to be quantified for each case separately.

# Conclusions IV

---

- Life Cycle Assessment as a balancing tool may help to maximise the positive and minimise the negative environmental effects via sensitivity analysis as well as weak-point analysis for the entire biogas life cycle from provision to utilisation.

**..... and finally:**

---

**Thank you very much  
for your attention**

**Tak for det**
